

# Theory of Computation

Fall 2021

1) Consider  $\Sigma_1 = \{a, b, c\}$ :

a) (5 pts) State the pumping Lemma for regular languages.

$\Rightarrow$  Pumping Lemma:

If  $A$  is a regular language, then there is a number  $p$  (the pumping length) where if  $s$  is any string in  $A$  of length at least  $p$ , then  $s$  may be divided into three pieces,  $s = xyz$ , satisfying the following conditions:

1. for each  $i \geq 0$ ,  $xy^i z \in A$ ,
2.  $|y| > 0$ , and
3.  $|xy| \leq p$

b) (5 pts) Is the following language regular or not?

$$L_1 = \{a^m b^n c^p : m \geq n \geq p \geq 0\}$$

$\Rightarrow L_1$  is not regular language.

c) (10 pts) Prove your answer to question b. You may yet use Pumping Lemma if needed.

$\Rightarrow$  Proof by contradiction:

Let's assume  $L = \{a^m b^n c^p : m \geq n \geq p \geq 0\}$  is regular language.

Let  $l$  be pumping length,  $|s| \geq l$  where  $s = xyz$  and  $s \in L$ .

$$\text{Let } s = a^l b^l c^l$$

(i)  $s = xyz$  where  $x = a^t$ ,  $y = a^t$ ,  $z = a^u b^l c^l$

-  $|y| > 0$

-  $xy^i z (\forall i \geq 0)$

-  $|xy| \leq l$

Consider  $i=0 \Rightarrow s_0 = a^{x+u} b^t c^l$

$$l = r + t + u$$

$$x+u \neq l$$

$$x+u \neq r+t+u$$

$$m \neq n$$

$$\therefore s_0 \notin L$$

$\therefore$  It is contradiction to our assumption

$\therefore L$  is not regular.

2) Consider the context-free language over  $\Sigma_2 = \{x, y\}$ :

$$L_2 = \{x^n y^n; n \geq 0\}$$

a) (10 pts) Give a context-free grammar for this language  $L_2$ .

$\Rightarrow$  CFG for  $L_2$ :  $G_2 = (V, \Sigma, R, S)$

$$V = \{S\}$$

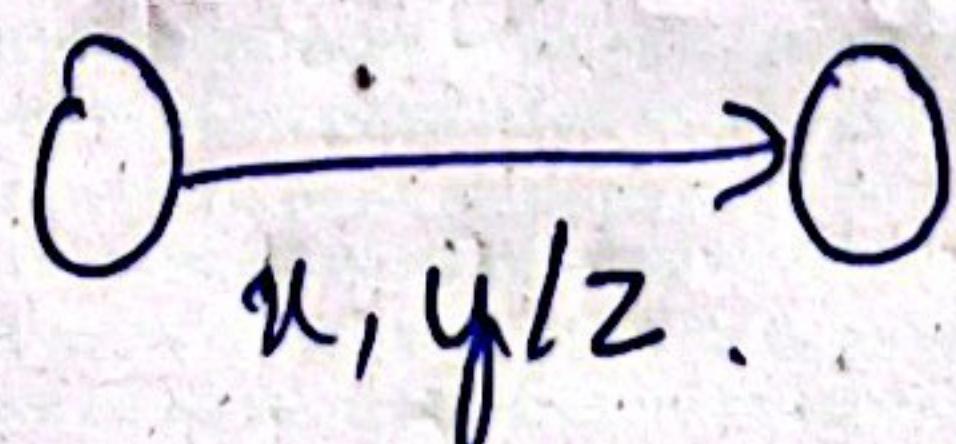

$$\Sigma = \{x, y, \epsilon\}$$

$$S = \{q_{v_0}\}$$

$$R = \{S \rightarrow xSy \mid \epsilon\}$$

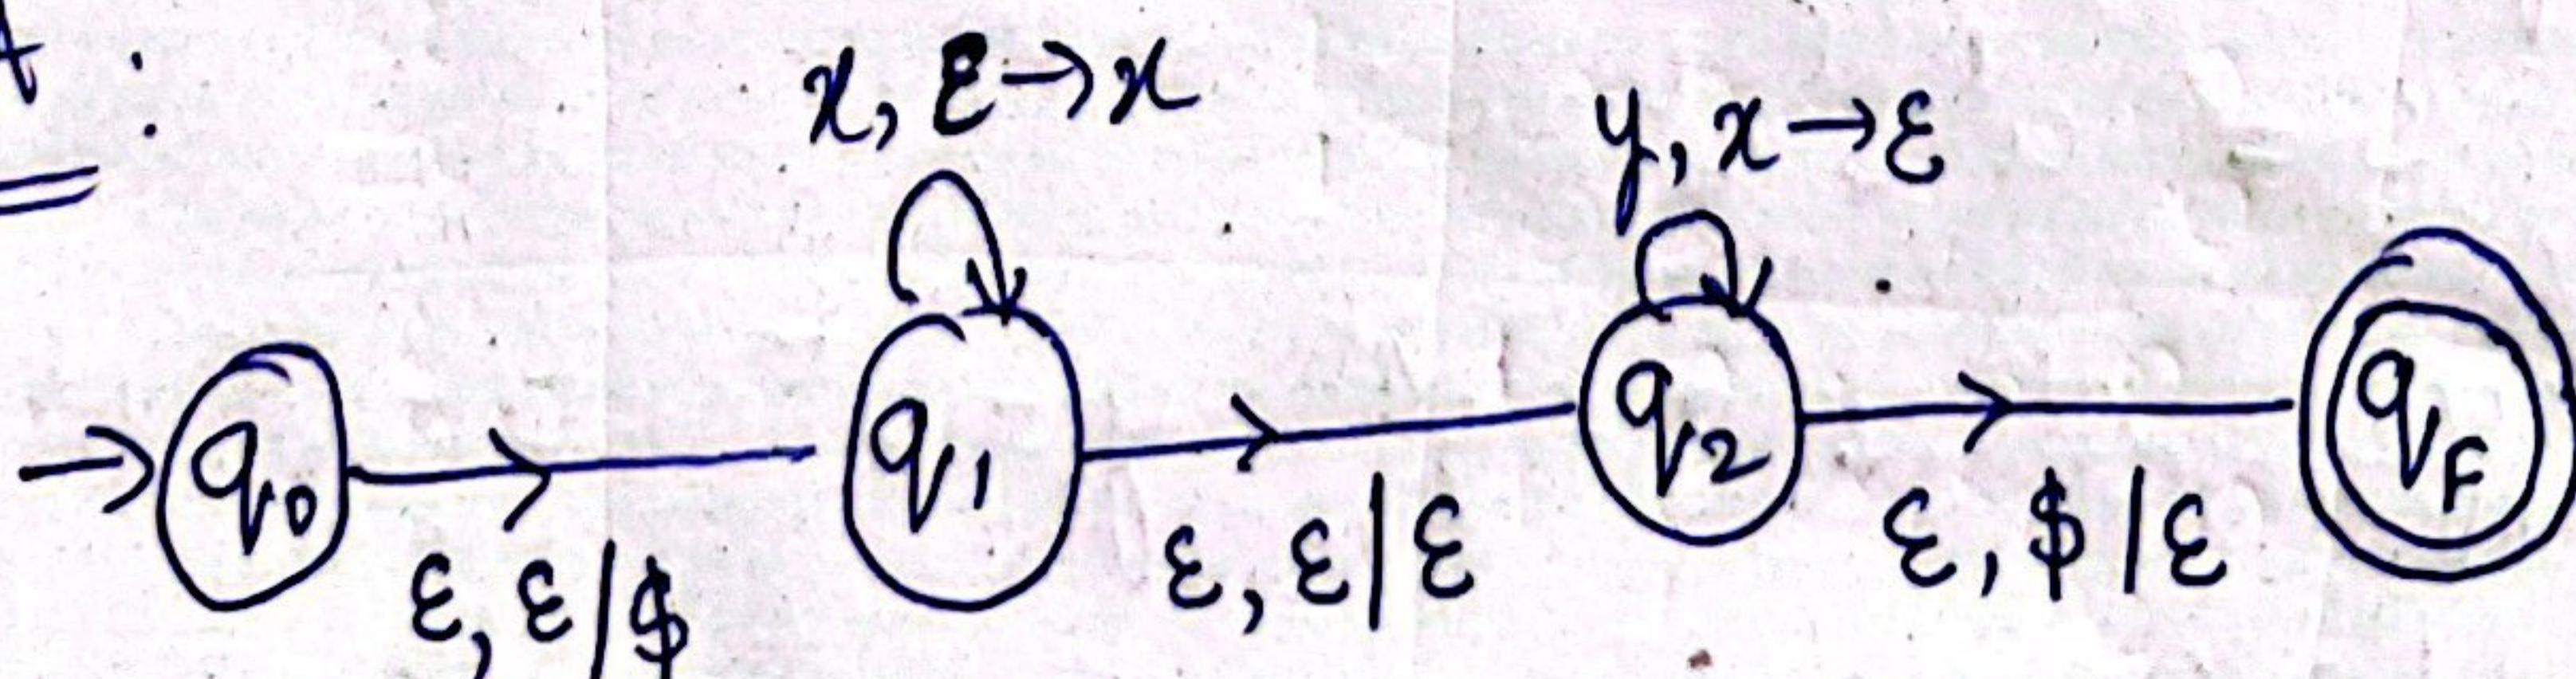

$$\left. \begin{array}{l} x^2 y^2 = xSy \\ xxSy \\ xx\epsilon yy \\ xx y y \\ x^2 y^2 \end{array} \right\}$$

b) (10 pts) Draw the state diagram of a pushdown automaton to recognize this language. You may use the following notation to label your machine's transitions.

(read input symbol x, stack top is y, push symbol z)

$\Rightarrow$  PDA:

3) The SUBSET-SUM Problem takes as input a set  $S$  of integers and an integer  $T$ , the question is whether there exists a non-empty subset  $R$  that sums to  $T$ .

a. (5 pts) Define polynomial-time reducibility  $A \leq_p B$ .

$\Rightarrow$  A language  $A$  is polynomial time reducible to another language  $B$  if there is a polynomial time computable function  $f: \Sigma^* \rightarrow \Sigma^*$  such that:  
 $w \in A \Leftrightarrow f(w) \in B$  for every  $w \in \Sigma^*$ .

Terminology / notation:

- $A \leq_p B$
- $f$  is the polynomial time reduction of  $A$  to  $B$
- "polynomial time many-one reducible".

b) (5 pts) In general, how do you prove that a given problem  $X$  is NP-complete? Please list the steps.

$\Rightarrow$  A language  $Y$  is NP-complete if:

1)  $Y$  is in NP, and

2) For every language  $X \in \text{NP}$  we have  $X \leq_p Y$ .

c) (10 pts) Prove that 3-CNF-SAT  $\leq_p$  SUBSET-SUM.

(3-CNF-SAT problem: Given a formula in 3-CNF, is there an assignment of the variables such that the formula evaluates to true?

For example,  $(x \vee \neg y \vee z) \wedge (\neg x \vee y \vee z) \wedge (\neg x \vee \neg y \vee \neg z)$  is a 3-CNF formula).

$\Rightarrow$  Let  $\phi$  be a Boolean formula with variables  $x_1, \dots, x_k$  and clauses  $C_1, \dots, C_k$ . The reduction converts  $\phi$  to an instance of the SUBSET-SUM problem  $\langle S, t \rangle$ , wherein the elements of  $S$  and the number  $t$  are the rows on the table, expressed in ordinary decimal notation. The rows above the double line are labeled.

$y_1, z_1, y_2, z_2, \dots, y_l, z_l$  and  $g_1, h_1, g_2, h_2, \dots, g_k, h_k$

and constitute the elements of  $S$ . The row below the double line is  $t$ .

Thus,  $S$  contains one pair of numbers,  $y_i, z_i$ , for each variable  $x_i$  in  $\phi$ . The decimal representation of these numbers is in two parts, as indicated in the table. The left-hand part comprises a 1 followed by  $l-i$  0's. The right-hand part contains one digit for each clause, where the digit of  $y_i$  in column  $c_j$  is 1 if clause  $c_j$  contains literal  $x_i$ , and the digit of  $z_i$  in column  $c_j$  is 1 if clause  $c_j$  contains literal  $\bar{x}_i$ . Digits not specified to be 1 or 0.

The table is partially filled in to illustrate sample clauses,  $c_1, c_2, \dots, c_k$ :

$$(x_1 \vee \bar{x}_2 \vee x_3) \wedge (x_2 \vee x_3 \vee \dots) \wedge \dots \wedge (\bar{x}_3 \vee \dots \vee \dots)$$

Additionally,  $S$  contains one pair of numbers,  $g_j, h_j$ , for each clause  $c_j$ . These two numbers are equal and consist of a 1 followed by  $k-j$  0's.

Finally, the target number  $t$ , the bottom row of the table, consists of  $l$  1's followed by  $k$  3's.

	1	2	3	4	...	l	$c_1, c_2, \dots, c_k$
$y_1$	1	0	0	0	...	0	1 0 0 0 0 0 0 0
$z_1$	1	0	0	0	0	0	0 0 0 0 0 0 0 0
$y_2$	1	0	0	0	0	0	0 1 0 0 0 0 0 0
$z_2$	1	0	0	0	0	0	0 0 1 0 0 0 0 0
$y_3$	1	0	0	0	0	0	0 0 0 1 0 0 0 0
